

INFRARED GAS ANALYZER

DATA SHEET

ZRE

This gas analyzer (ZRE) is capable of measuring the concentration of NO, SO₂, CO₂, CO, CH₄ and O₂ components in sample gas. NO, SO₂, CO₂, CO and CH₄ are measured by non-dispersion infrared method (NDIR), while O₂ is measured by fuel cell, or zirconia method. Up to 5 components including O₂ can be measured simultaneously.

This analyzer is designed with smaller physical dimensions. It is well suited for compact analyzing system designs. In addition maintenance is simplified through adoption of the single-beam system.

Optimum use as an analyzer unit of measurement system for combustion exhaust gas from refuse incinerator and boiler, or gas from various industrial furnaces.

FEATURES

1. Small and light

The size is small 133×483×418mm (H×W×D) and light (8kg).

But it is capable max. 5 component measurement in one analyzer.

2. Easy maintenance

Because of single-beam system the measurement unit is simple with no need for optical adjustment. Therefore, maintenance is easy.

3. Easy operation

Operation can be carried out smoothly in an interactive way through a large-size LCD.

4. Abundant functions

Various optional functions are available such as auto calibration control, high and low concentration alarm, remote range switch, and range identification signal, etc.

Standard Functions**Output signal holding:**

Output signals are held during manual and auto calibrations by activation of holding (turning "ON" its setting).

The output to be held are the ones just before start calibration mode or setting value.

It is selectable.

Indication of instantaneous values will not be held.

Switch ranges: The switch ranges function is available in manual, auto, and remote modes. Only preset switch method is effective.

Manual: Allows range to switch by key operation.

Auto: Allows range to switch from low to high range when 90%FS or more is available in the low range.

Allows range to switch from high to low range when 80%FS or less is available in the low range.

Remote: Voltage contact input (for measurable components)

(Option) Allows range to switch via an external signal when remote range switch input is received.

When the contact input terminals for each component are input voltage, the first range is selected, and it is switched to the second range when the terminals are open.

Optional Functions**Remote output holding:**

Output signal is held at the latest value or setting value by voltage input the remote output holding input terminals.

Holding is maintained while the voltage input the terminals. Indication of instantaneous values will not be held.

Range identification signal:

The present measuring range is identified by a contact signal.

The contact output terminals for each component turn on when the first range is selected, and when the second range is selected, the terminals are open.

Auto calibration:

Auto calibration is carried out periodically at the preset cycle.

When a standard gas cylinder for calibration and a solenoid valve for opening/closing the gas flow line are prepared externally by the customer, calibration will be carried out with the solenoid valve drive contacts for zero calibration and each span calibration turned on/off sequentially at the set auto calibration timing.

Auto calibration cycle setting:

Auto calibration cycle is set.

Setting is variable within 1 to 99 hours (in increments of 1 hour) or 1 to 40 days (in increments of 1 day).

Gas flow time setting:
The time for flowing each calibration gas in auto calibration is set.
Settable within 60 to 900 seconds (in increments of 1 second)

Auto calibration remote start:
Auto calibration is carried out only once according to an external input signal. Calibration sequence is settable in the same way as the general auto calibration.
Auto calibration is started by opening the auto calibration remote start input terminals after input voltage for 1.5 seconds or longer.

Auto zero calibration:
Auto zero calibration is carried out periodically at the preset cycle.
This cycle is independent on "Auto calibration" cycle.
When zero calibration gas and solenoid valve for opening/closing the calibration gas flow line are prepared externally by the customer, zero calibration will be carried out with the solenoid valve drive contact for zero calibration turned on/off at the set auto zero calibration timing.

Auto zero calibration cycle setting:
Auto zero calibration cycle is set.
Setting is variable within 1 to 99 hours (in increments of 1 hour) or Setting is variable within 1 to 40 days (in increments of 1 day)

Gas flow time setting:
The timing for flowing zero gas in auto zero calibration is set.
Settable 60 to 900 seconds (in increments of 1 second)

High/low limit alarm:
Alarm contact output turns on when measurement value reach the preset high or low limit alarm value.
Contacts turn on when the channel value of each channel exceeds the high alarm limit value or falls below the low alarm limit value.

Instrument error contact output:
Contacts turn on at occurrence of analyzer error No. 1, 2, 3 or 10.

Calibration error contact output:
Contacts turn on at occurrence of manual or auto calibration error (any of errors No. 4 to 9).

Auto calibration status contact outputs:
Contacts turn on during auto calibration.

O₂ correction: Correction of measured NO, SO₂ and CO gas concentrations into values at reference O₂ concentration

Correction formula:

$$C = \frac{21-O_n}{21-O_s} \times C_s$$

C : Sample gas concentration after O₂ correction

C_s : Measured concentration of sample gas

O_s : Measured O₂ concentration (Limit setting: 1 to 20% O₂)

O_v : Reference O₂ concentration (value changeable by setting. 0 to 19% O₂)

Average value after O₂ correction and O₂ average value calculation:

The result of O₂ correction or instantaneous O₂ value can be outputted as an average value in the preset period of time.

Used for averaging is the moving average method in which sampling is carried out at intervals of 30 seconds.

(Output is updated every 30 seconds. It is the average value in the determined period of time just before the latest updating.)

Averaging time is settable within 1 to 59 minutes (in increments of 1 minute) or 1 to 4 hours (in increments of 1 hour).

Average value resetting:

The above-mentioned output of average value is started from the initial state by opening the average value resetting input terminals after input voltage for 1.5 seconds or longer.

Output is reset by input voltage and restarted by opening

Communication function:

RS-485 (9pins D-sub) or USB (Type-B)

Half-duplex bit serial

Start-stop synchronization

Modbus™ protocol

Contents : Read/Write parameters

Read measurement concentration and instrument status

Remark : When connecting via RS-232C interface, an RS-232C ↔ RS-485 converter should be used.

Examples of sampling system configuration including gas analyzer

To measure low moisture content (saturated at room temperature or lower) sample gas (CO, CO₂, CH₄)

To measure high moisture content sample gas, NO, SO₂, or CO (0 to 200 ppm range)

*1) Be sure to use a dehumidifier such as electronic cooler for NO, SO₂, and CO analyzers of 0 to 200 ppm range (≈2°C saturation or lower).

*2) Be sure to use auto zero calibration, in the case of 500 ppm or less range.

Procedure of range selection

On one component analyzer:

First determine 1st range, then select 2nd range from the right of your determination range in following tables.

More than two components:

The procedure is same as one component. Difference is 2nd range in the tables.

The 2nd range in the tables for two and more components is maximum available range.

2nd range is selectable from 1st range to 2nd range(max) on the table.

The items in the parentheses may not be available depending on the selected type on 22th digit.

The normal open side (NO) of digital output is close when the function is active without range ID.

In case of range ID, normal open (NO) side is close with Lo-range. The normal close (NC) side is close with Hi-range.

Exclusive Zirconia O₂ Sensor (to be purchased separately)

For O₂ correction, the gas analyzer ZRE can accept linearized 0 to 1V DC signal coming from analyzer calibrated 0 to 25% O₂ full scale. If the analyzer is not available, Fuji can supply exclusive Zirconia O₂ sensor Model ZFK.

Measuring method:

Zirconia system

Measurable component and measuring range:

Measurable component		Range
O ₂	Oxygen	0 to 25vol%

- Repeatability:** Within ± 0.5% of full scale
- Linearity:** Within ± 1% of full scale
- Zero drift:** Within ± 1% of full scale/week
- Span drift:** Within ± 2% of full scale/week
- Response time:** Approx. 20 seconds (for 90% response)
- Measured gas flow rate:** 0.5 ± 0.25L / min

Remark: The Zirconia system, due to its principle, may produce a measuring error due to relative concentration versus the combustible O₂ gas concentration. Also, a corrosive gas (SO₂ of 250 ppm or more, etc.) may affect the life of the sensor.

Gas inlet/outlet size:

Rc¹/₄ or NPT¹/₄

- Power supply:** Rated voltage ; 100 to 115V AC or 200 to 240V AC
- Rated frequency ; 50Hz/60Hz
- Max. rated power; 215VA (during power ON)
65VA (during steady-state operation)

- Enclosure:** Steel casing, for indoor application
- Indication:** Temperature indication (LED)
- Temperature alarm output:** Contact output 1a contact,
Contact capacity 220V, 1A AC (resistive load)

- Outer dimensions (H x W x D):** 140 x 170 x 190mm

- Mass {weight}:** Approx. 3kg
- Finish color:** Munsell 5Y 7/1
